

Flyeasy

Flyeasy is a website platform with the purpose of connecting people who are going to fly by airplane. The idea is to ease the flight fright/anxiety/uncertainty of people traveling alone by connecting them with the people who are in the same situation.

In general, the platform will work in these steps:

- * The user is able to enter their first and last name, email and password, as a form of registration. Verify email address compatibility.
- * Or they can successfully login by entering their email and password.
- * Their profile page has some simple information like a placeholder for their photo, their first and last name, email, switch to indicate if the user is available to be contacted by others or not, and a description textarea where they can write anything they want to share.
- * In addition, add a separate section within the profile page (or maybe an entire other page, say named 'My Flights') where the logged in user enters his/her flight information such as flight number, flight origin and destination, flight date and time and flight duration. This page would have a list of different flights because simply one person will have many flights in their lifetime. Offer filtering options to filter by flight status like: Past/Future/Ongoing flights, flight airline, and flight duration. Also add a search bar.

Explanation: For an initial version, have the user enter flight information such as origin and destination. In later versions, update this to automatically scrape such information via flight number and date/time.

- * Once they login successfully, they will be able to see a list of people that have the same flight (maybe show them as cards horizontally). Each card section holds the user's information such as their profile pic, flight information and description. Also, each card will have a connect button which allows the user to send sort of a 'friend request' to the other person, let's name it 'Connect' button.

- * This Connect request is received on the other hand, in which case the user will have a page or tab with all their requests awaiting. Here the user will be able to see the other person's information such as their name and flight information and their description. And allow a button to accept or decline their request.

- * There will be another separate tab or area where the user will be able to see all their approved connections (perhaps show those as cards as well). Here offer a button to chat to the other person.

- * The platform will hence have the chatting option between two connected users (open the chat in a new tab).

Explanation: For an initial version, have the user be able to chat only with one connected person with the same flight (not group chats). Also, it is very important that the chat availability between those two users ends after the flight has successfully finished. In this case, the users are not able to chat anymore regarding that flight, and the chat will remain there only for history purposes.

In later versions, update to allow group chats.
